

Global Shipping & Logistics Companies Database Analysis

Researched the web for shipping companies, collected, entered and structured data from 60 international shipping and logistics companies using publicly available online sources. The dataset was collected, standardized, and prepared for analysis using Excel, SQL, and Power BI and generated business insights. The analysis focused on the geographic distribution of logistics companies across different countries. The results show that the logistics companies in the dataset are spread across 21 countries, indicating a diverse international presence within the shipping and logistics industry.

Skills Demonstrated

- Data Entry
- Data Collection
- Excel
- SQL
- Power BI
- Data Quality Management
- Data Query
- Data Visualization

Key Findings

Nigeria Has the Highest Representation

Nigeria recorded the highest number of companies in the dataset with 7 companies (11.7%).

This suggests:

- A growing logistics sector in Nigeria.
- Increased demand for freight, shipping, and supply chain services.
- Strong participation of Nigerian logistics firms in international trade activities.

The UK Is the Second Largest Hub

The United Kingdom accounted for 5 companies (8.3%), making it the second most represented country.

This highlights:

- The UK's importance as a global logistics and trade hub.
- Strong shipping infrastructure and international connectivity.

Cyprus, USA, and Other Developed Markets Remain Important

Countries such as:

Cyprus (4)

USA (4)

show strong representation despite their smaller populations (especially Cyprus).

This may indicate:

- Strategic maritime locations.
- Advanced logistics infrastructure.
- Established shipping and freight forwarding industries.

Global Distribution of Logistics Companies

The dataset covers companies from:

Africa

Europe

North America

Asia

Oceania

This demonstrates the international nature of the logistics industry and highlights the interconnectedness of global supply chains.

Emerging Markets Are Well Represented

Countries such as: Ghana, South Africa, Philippines, Türkiye and Argentina appear in the dataset, suggesting increasing participation of emerging economies in international logistics operations.

Business Insights

- Geographic Diversity

The dataset is not concentrated in a single region, reducing geographic bias and providing a broader view of the global logistics market.

- Logistics Activity Clusters

Higher company counts in Nigeria, UK, USA and Cyprus suggest that these countries serve as important logistics and transportation hubs.

- Market Expansion Opportunities

Countries with fewer represented companies may offer opportunities for market entry, business expansion, strategic partnerships for logistics providers seeking international growth.

Recommendations

1. Focus on High-Concentration Markets

Organizations seeking logistics partnerships should prioritize Nigeria, United Kingdom, United States and Cyprus. These countries demonstrate strong representation and established logistics ecosystems.

2. Explore Emerging Logistics Markets

Businesses should investigate opportunities in Ghana, South Africa, Philippines, Türkiye and Argentina. These markets may offer growth potential and less competitive environments.

3. Expand Data Collection

Future analyses should include company size, revenue, number of employees and service type (air freight, ocean freight, warehousing, customs brokerage, etc.). this would allow deeper business intelligence and industry segmentation.

4. Build a Global Logistics Intelligence Dashboard

Additional Power BI enhancements could include country performance rankings, interactive maps, regional comparisons, website availability analysis and service category analysis to support strategic decision-making.

Conclusion

The analysis reveals a geographically diverse logistics industry with Nigeria, the United Kingdom, Cyprus, and the United States emerging as the most represented countries within the dataset. While established logistics hubs continue to dominate, emerging markets also demonstrate meaningful participation, highlighting opportunities for future growth and international collaboration.

Tools Used: Excel, SQL, Power BI

Dataset Size: 60 International Shipping & Logistics Companies

Countries Covered: 21 Countries

Companies in USA Analysis

The result shows that there is a geographic concentration.

Out of the 4 U.S. companies:

New York 3 companies (75%)
Dover 1 company (25%)

This indicates that your U.S. logistics records are heavily concentrated in New York, which is expected because New York is a major international trade and shipping hub with access to large ports, airports, and global freight networks.

Business Insight

The dominance of New York suggests that logistics companies tend to establish operations in cities with:

- High international trade volumes
- Strong transportation infrastructure

- Access to ports and airports
- Large customer markets

UK Logistics Companies Analysis

Dataset Summary:

The United Kingdom accounted for 5 companies, representing 8.3% of the total dataset (60 companies).

City	Number of Companies
London	3
Mildenhall	1
Sale	1

Key Findings

1. London Dominates the UK Logistics Sector

Out of the 5 UK companies identified:

London 3 companies (60%)
Mildenhall 1 company (20%)
Sale 1 company (20%)

This indicates that London serves as the primary logistics and shipping hub within the UK segment of the dataset.

2. Strategic Importance of London

The concentration of logistics companies in London can be attributed to:

- Access to international trade routes
- Proximity to major airports and seaports

- Strong business infrastructure
- High volume of import and export activities

As one of the world's leading financial and commercial centers, London provides logistics companies with access to global markets and international clients.

3. Regional Logistics Presence

The presence of companies in Mildenhall and Sale suggests that logistics operations are not limited to London and extend into regional markets that support warehousing, freight forwarding, and transportation services.

Business Insight

The UK's logistics sector appears to be highly centralized around London while maintaining supporting operations in smaller regional locations.

This structure allows logistics companies to:

- Coordinate international shipments through London.
- Serve regional customers efficiently.
- Expand transportation networks beyond major metropolitan areas.

Recommendation

Organizations seeking logistics partnerships within the UK should consider London as primary hub and Mildenhall and Sale as secondary locations because these locations may offer operational advantages depending on transportation routes, warehousing requirements, and customer proximity.

Nigeria Logistics Companies Analysis

Dataset Insight: Nigeria recorded the highest number of logistics companies (7) representing approximately 11.7% of all 60 companies analyzed, with all identified firms operating from Lagos. This underscores Lagos' position as the leading logistics and maritime gateway in Nigeria and one of the most important trade hubs in West Africa.

Geographic Distribution

City	Number of Companies
------	---------------------

Lagos	7
-------	---

Key Finding

A striking observation is that 100% of the Nigerian logistics companies in the dataset are located in Lagos. This indicates a very strong concentration of logistics and shipping activities within Lagos, making it the dominant logistics hub in Nigeria.

Business Insights

Lagos Is Nigeria's Logistics Capital

The concentration of all identified logistics companies in Lagos reflects the city's strategic importance in international trade and transportation. Several factors contribute to this dominance:

- Presence of major seaports such as Apapa and Tin Can Island Ports.
- Access to international shipping routes.
- Large industrial and commercial activities.
- High volume of imports and exports.
- Strong transportation and warehousing infrastructure.

Shipping Activities Are Highly Centralized

The dataset suggests that logistics operations in Nigeria are largely centralized in Lagos rather than being evenly distributed across multiple cities.

This concentration can improve operational efficiency but may also create challenges such as:

- Port congestion.
- Traffic-related delays.
- Increased operational costs during peak periods.

Strong Market Potential

The presence of multiple logistics providers indicates a competitive and active logistics market.

Companies such as:

- Fortune Global Shipping & Logistics Limited
- Supermaritime Nigeria Ltd
- Emy Cargo & Shipping Nigerian Limited
- KTG Shipping International
- Saima Nigeria Limited
- PF Xpress Logistics
- Cargonaija

demonstrate the diversity of logistics service providers operating within Lagos.

Recommendation

For Businesses Seeking Logistics Partners Lagos should be the primary location considered when sourcing shipping and logistics services in Nigeria due to its concentration of providers and infrastructure.

For Future Expansion Analysis

Organizations may explore opportunities in emerging logistics markets outside Lagos, such as:

- Port Harcourt
- Onne
- Kano
- Abuja

to reduce dependence on a single logistics hub and improve nationwide distribution coverage.
